November 2005

Published_Applications Nucleic Acid and Published_Applications Amino Acid database searches now generate two sets of results each. The Published_Applications databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published_Applications_New databases; older published applications make up the Published_Applications_Main databases.

Searches run against Nucleic Acid Published_Applications produce two sets of results, with the extensions .rnpbm (Published_Applications_NA_Main) and .rnpbn (Published_Applications_NA_New).

Searches run against Amino Acid Published_Applications produce two sets of results, with the extensions .rapbm (Published_Applications_AA_New).

Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession numbers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            84
           Plant Mol. Biol. 15:197-201(1990).

-!- FUNCTION: Seed storage protein. Accumulates during seed development and is hydrolyzed after germination to provide a carbon and nitrogen source for the developing seedling.

-!- SUBUNIT: The alpha'-, and beta-subunits associate in various combinations to form trimeric proteins.

-!- SUBCELLUIAR LOCATION: Embryo axis, and cotyledonary membrane-bound

                                                                         ò
                                                                                                        ò
                                                                      This is the amino acid sequence of the Ara h 1 protein from Arachis hypogea. The Ara h 1 protein has 23 IgE (Immunoglobulin E) binding exployes, four of which are immunodominant (AAY1524), AAY15250 and AAY15263. By modifying the IgE binding sites the ability of the allergen to provoke an immune response is downregulated. The epitopes of the IgE binding sites can therefore be modified in genetically engineered plants and animals to elicit less of an allergic response. (Updated on 17-0CT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen and comprises administering to the patient a peptide derived from the allergen and by the patient can be demonstrated for the peptide and the possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who peptide is able to induce a late phase response in an individual who desensitising patients to allergens present in e.g. grass, tree and weed including ragweed) pollens, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit fly, sheep blow fly, screw worm fly, grain weevil, silkworm, honeybee, non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of renibitor molitor beetle, mammals such as cat, dog, horse, cow, pig, sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence represents a peanut (Arachis hypogea) allergen 1168391 Ara h I. (Updated on 17-OCT-2003 to standardise OS field)

```
The invention relates to a modified anaphylactic food allergen has an amino acid sequence that is substantially identical to that of natural anaphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The modified so that it cannot participate in the disulphide bond. The modified along along included are: (1) a method of making a modified anaphylactic food allergen; (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (4) a method of treating the modified anaphylactic food allergen; (5) a ranapsense to a natural anaphylactic food allergen; (6) anaphylactic food allergen is useful for preventing or treating allergic reactions associated with any natural allergen such as food, insect, rubber or preferably anaphylactic allergens. It is also useful for treating wounds in mammals such as bovine, canine, feline, caprine, ovine, porcine, murine or equine species. The present sequence is a contract allergen (e.g. Ara hl, h2 or h3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CGCTGCACCAAGCTCGAGTATGATCCTCGTTGTGTCTATGATCCTCGAGGACACACTGGC 289

                                              to a selected polypeptide antigen. The method comprises administering a composition that contains polypeptide antigens in an amount that generates in the individual a state of hyporesponsiveness to the antigen of allow desensitisation to one or more polypeptide antigens. The method of the invention has immunomodulator activity, and may have a use in generapy. The composition and method are useful in manufacturing a medicament for desensitising an individual to a selected polypeptide antigen or for generating in the individual a state of hyporesponsiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The present sequence is used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel isolated nucleic acid molecule encoding the peanut allergen Ara h I that has been identified in patients with atopic dermatitis. Specifically, it refers to a monoclonal antibody enzyme-linked immunosorbant assay (BLISA) used to detect and quantify the peanut allergens, where the monoclonal antibodies have specificity for a selected peanut allergen antigen. The present invention also describes hybridomas that produce two-site monoclonal antibodies specific for a peanut allergen that can be used in an ELISA to detect and determine the concentration of a specific peanut allergen in a food product or in food processing. Furthermore, it provides an expression vector and the isolated nucleic acid or its fraction can include a diagnostic label. Accordingly, these nucleic acids are useful for obtaining diagnostics with optimal concentrations of each allergen or for developing panels of mixtures of large numbers of recombinant allergens such that it can be used in immunotherapy for the treatment of food hypersensitivity reactions. This polypeptide sequence is the peanut Ara I allergen

The sequence represents the amino acid sequence of anaphylactic antigen C Ara h 1. Ara h 1 is an anaphylactic antigen (A), which was used to design antigenic peptides having a reduced ability to bind immunoglobulin E (IGE) as compared with the intact (A), or having a sequence substantially defining size, where at least one IGE binding site of the peptide cone IGE binding site of the peptide is altered. The antigenic peptides are used in a composition which is useful for reducing risk or severity of allergic reaction to an antigen. This is done by identifying prior display of allergic symptoms when exposed to the antigen, or a familial relationship with an individual who content of an antigen specific IGE present on one or more mast cells or basophils in the individual's serum is identified. The individual is the individual's serum is identified. The individual is the individual's serum is identified. The individual is then contented with a peptide corresponding to a portion of the antigen. Which is selected, formulated, and delivered so that binding of the peptide to antigen. Specific IGE is reduced as compared with IGE binding of previously in the composition is also useful for treating and
